# Applying our market-first science driven models to fresh Vegetables

# Value Chains are the Model Used. Mitengo Women in Zambia Produce High Quality Vegetables for supermarkets

# Public-Private Partnerships for economic development using technologies to reduce poverty

Partnership between ASNAPP and Sun International hotel served as a driver for the supply of high quality vegetables by farmer groups.

Our farmer groups (including disabled heads of households) now meet quality, time of delivery, and have earned >\$3 million by providing as much as >85% fresh produce and culinary herbs. And, had no prior commercial horticultural experience.

# Greenhouse Specialty Vegetables Livingstone, Zambia

# Open field vegetables Disabled community Livingstone, Zambia

# From Seeds and Plants to Nursery

# **Good Crop Management**

- Success in horticultural production builds upon good management;
- Horticultural production relative to agronomic production is knowledge intensive, requires significant management input from selection of crop enterprises, production, crop rotations, scheduling all inputs from seeds- final products sold.

# Many projects focus on the production/supply side of value chain w/out a focus on Postharvest Handling of F&Vs and AIVS

Why is it relevant?

- ▶ Access to new markets- more formal ones such as supermarkets, distribution centers, buyers and traders for longer distance shipping
- ▶ Increase sales
- ▶ Reduce waste and spoilage
- ▶ Increase shelf-life to market
- ▶ Most of the investment already made; yields often a limiting factor due to low inputs by smaller holder, PH can often make a real difference between profit or loss.

# Washing, Cleaning, Sorting, Bundling (clean water is important)

# A Fresh Market in Eldoret, Western Kenya

# Water: Used to cool and keep produce looking fresh

# Basics of Postharvest Handling & Storage

- ▶ Keeping F&Vs cool after harvest can more than double their postharvest life for each 10° C decrease in handling temperature.
- ▶ Keeping F&Vs cool **will reduce the rate of water loss** (and reduce the related wilting, shriveling, yellowing)
- ▶ Keeping F&Vs cool **will reduce the rate of decay** (and reduce related rotting, oozing, mushiness, browning)
- ▶ Keeping F&Vs cool and minimally developing practical systems to keep produce as intact, fresh, turgid, and free/clean from pests increases your marketable product.
- ▶ Your agricultural inputs in production remain the same- the risks are minimized when you now focus on post-harvest as much as you focus on production.
- ▶ There are many steps you can do even without coolers and fancy equipment.

# Cool Chain: Step 1

**Harvest during the cooler times of day (in the early morning or even at night-time if possible)**

▶ Leafy greens will stay fresh for about only one day at 30° C

▶ ‘General’ effect of temperature on postharvest life of F&Vs:

The harvested crops are alive, breathing and the growers task is to keep it as fresh as possible

Temperature	Postharvest Life
40° C	½ day
30° C	1 day
20° C	2 days
10° C	4 days
0° C	8 days

# Cool Chain: Step 2

## Product Protection At Harvest:

- ▶ **Keep harvested produce out of direct sunlight.**
- ▶ Use shade immediately after harvest. Shade keeps produce (estimated) 10 to 15° C cooler than air temperature at very low cost. Plan this at or even before production time!
- ▶ **Shade** can be expensive or inexpensive when using local materials.
- ▶ From moving produce into shade under live trees, or introducing open sheds, building overhangs, and even rigging up shade cloth on an open pickup truck or wagon. Shade cloth or grass, palm as thatched materials all can serve as cover on poles, **market umbrellas**, etc.

# Cool Chain: Step 3- if possible

Next step forward is to introduce cooling into your production system and use it for those products which would gain most and generate highest earnings.

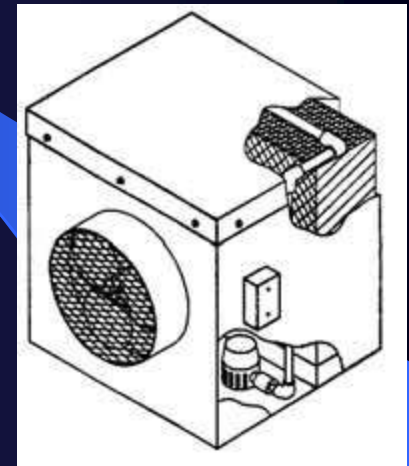

- ▶ Evaporative forced air cooling (uses moist air to cool to within 2° C above dew point temperature)– works best in dry regions or during the dry season
- ▶ Use of ice – crushed ice can be used to cool some vegetables to low temperatures (but may be very expensive to purchase or make)
- ▶ Refrigerated cold room – low cost systems such as the CoolBot™ can be used to cool small insulated storage rooms if electricity is available. (We will focus here)

# Evaporative forced air cooling

- Cut-away view of an evaporative cooler

Crates  
of  
produce

# Evaporative Cool Storage- is it really helpful for larger growers?

- ▶ Zero Energy Cool Chamber (ZECC)
- ▶ Developed in India in the 1980s by Dr. S K Roy
- ▶ Bricks and sand storage boxes, kept moist with a gravity fed drip system
- ▶ Passive system (no power needed)
- ▶ Low cost

Similar systems in use:  
Charcoal walls (Kenya)  
Fabric tents (Cambodia)  
Clay in clay jars (Nigeria)

# Cool Chain: Step 4

## Short term cold storage

- ▶ May extend F&Vs when kept at 5 to 10° C their postharvest life for up to one week.
- ▶ CoolBot™ can be used with a regular window style air conditioning unit to cool storage air down to 2° C.
- ▶ Need to use containers that allow good air circulation within the cold room for best results. (Example: plastic crates; properly placed to facilitate airflow)

# CoolBot™

- ▶ Cost of A/C with CoolBot™ refrigeration installation is about 1/10 that of the cost of commercial systems designed for a traditional small cold room. Designed and commercialized by Ron and Kathryn Khosla, truck farmers in New Paltz, NY.
- ▶ Refrigerated cold rooms are most useful for storing higher value crops.
- ▶ Requires a cold room with excellent quality insulation, no air leaks.
- ▶ Power use estimation:
  - ▶ 35 kWh/MT for 12° C
  - ▶ 50 kWh/MT for 2° C
- ▶ <http://storeitcold.com>

# CoolBot™ Cold Rooms

## Size of storage room

Approximately 60% of the floor space is usable for storage, as the rest is taken up by doorways, aisles and open space left along the walls- all needed to ensure proper airflow.

- ▶ Typically window style air conditioners (A/Cs) are sold in two sizes

	Recommended Size of storage room
12,000 BTU A/C	8 x 8 ft
18,000 BTU A/C	8 x 12 ft
Two 18,000 BTU A/Cs , two Coolbots	10 x 20 ft

- ▶ 12,000 BTU = 3.5 kW =1 ton of refrigeration

# CoolBot™ Cold Rooms

## Design recommendations

- ▶ Locate the entire cold room under shade
- ▶ Keep the A/C unit out of direct sun
- ▶ Sealing for vapor barriers to the outside (the hotter side) of the constructed walls
- ▶ Single door located in a short wall
- ▶ Door that closes tightly
- ▶ No windows; ensure AC vent is closed, no leaks
- ▶ Plastic strip curtains to keep the cool inside when the door is opened
- ▶ Floor with easy to clean surface (ex: cement)
- ▶ 8 to 9 feet tall inside

# CoolBot™ Cold Rooms

## Construction materials

- ▶ Locally available materials must conform to the needed specifications
- ▶ R20 minimum for walls and door
- ▶ R30 for floor and roof

R value = insulation value, higher is better

- ▶ 8 inch cement block = R1
- ▶ One inch of wood shavings, sawdust, straw bale = R2
- ▶ Example materials and price list:

[http://www.bae.uky.edu/ext/Specialty\\_Crops/PDFs/Material\\_and\\_Price\\_List\\_for\\_Low-Cost\\_Cold\\_Storage\\_Room\\_for\\_Market\\_Growers.pdf](http://www.bae.uky.edu/ext/Specialty_Crops/PDFs/Material_and_Price_List_for_Low-Cost_Cold_Storage_Room_for_Market_Growers.pdf)

**CoolBot™ Controller showing frost on coils, the heater that defeats thermostat (surrounded by foil) and sensor in the coils detect formation of frost.**

# Coolbot room temperatures, Davis

# CoolBot™ Cold Rooms

## Electricity

- ▶ Requires a power source of 120 or 220 volts
- ▶ Back-up generator needed to provide temporary electric power if the power goes down.
- ▶ Solar electric power is a possibility in some locations (being used in Uganda under a Hort CRSP Exploratory Project, M. Reid)

# CoolBot™ Cold Rooms

## Installation

- ▶ Simple installation and set-up
- ▶ Video of the installation process
- ▶ <http://storeitcold.com/install.php>

## Installation Instructions

# CoolBot™ Cold Rooms

**Management and Logistics- or a single family or grower cooperative/associations**

- ▶ Inventory control and labels (who owns what inside the cold room? How is produce organized, stacked so it can be found quickly and easily?)
- ▶ First in- first out
- ▶ Inspections (Grading, sorting, maintenance)
- ▶ Sanitation
- ▶ Keep containers off the floor and away from the walls
- ▶ Recordkeeping;

# CoolBot™ Cold Rooms

## Financing and ownership options

- ▶ Estimated costs total approximately US\$3,000 for a cold room that will hold 3 to 4 MT of produce.
- ▶ Cold room can be owned by a family, an association, even our project, and use can be offered by the project managers on a **fee for service** basis (usually set at a small fee per kg per day).
- ▶ Grower groups can be owners of the cold room by taking out a loan for construction and repaying it back over time.

# Introduction of the CoolBot into Zambia (Chipata & Livingstone)

# ShadeBot ©

# ShadeBot and CoolBot Monitoring Experiment

## Experiment Overview

Multiple plants were harvested and stored in different environments.

Temperature and relative humidity was monitored.

The purpose of this experiment is determine how efficient the ShadeBot and CoolBot (turned off) were in reducing the temperature and relative humidity.

Plants Harvested:

- Cabbage
- Lettuce
- Green Beans
- Spinach
- Carrots

# Experimental Details

Three sensors were used in this experiment to determine the influence of the ShadeBot and the CoolBot (Turned Off) in altering the environment in which the produce will be respiring.

Temperature and relative humidity reading were taken every five minutes for eight days in Nsongwe, Zambia.

This illustration will be for just one time point and also during a colder time period to be more conservative. Readings were taken in the time period from 6/11/2014 through 6/18/2014

Sensor Locations:

- CoolBot
- ShadeBot
- In the field

-CoolBot Sensor

-ShadeBot Sensor

-Field Sensor

## Highlighted Findings on Temperature

Both the ShadeBot and CoolBot were effective in reducing the temperature when compared to the field temperature.

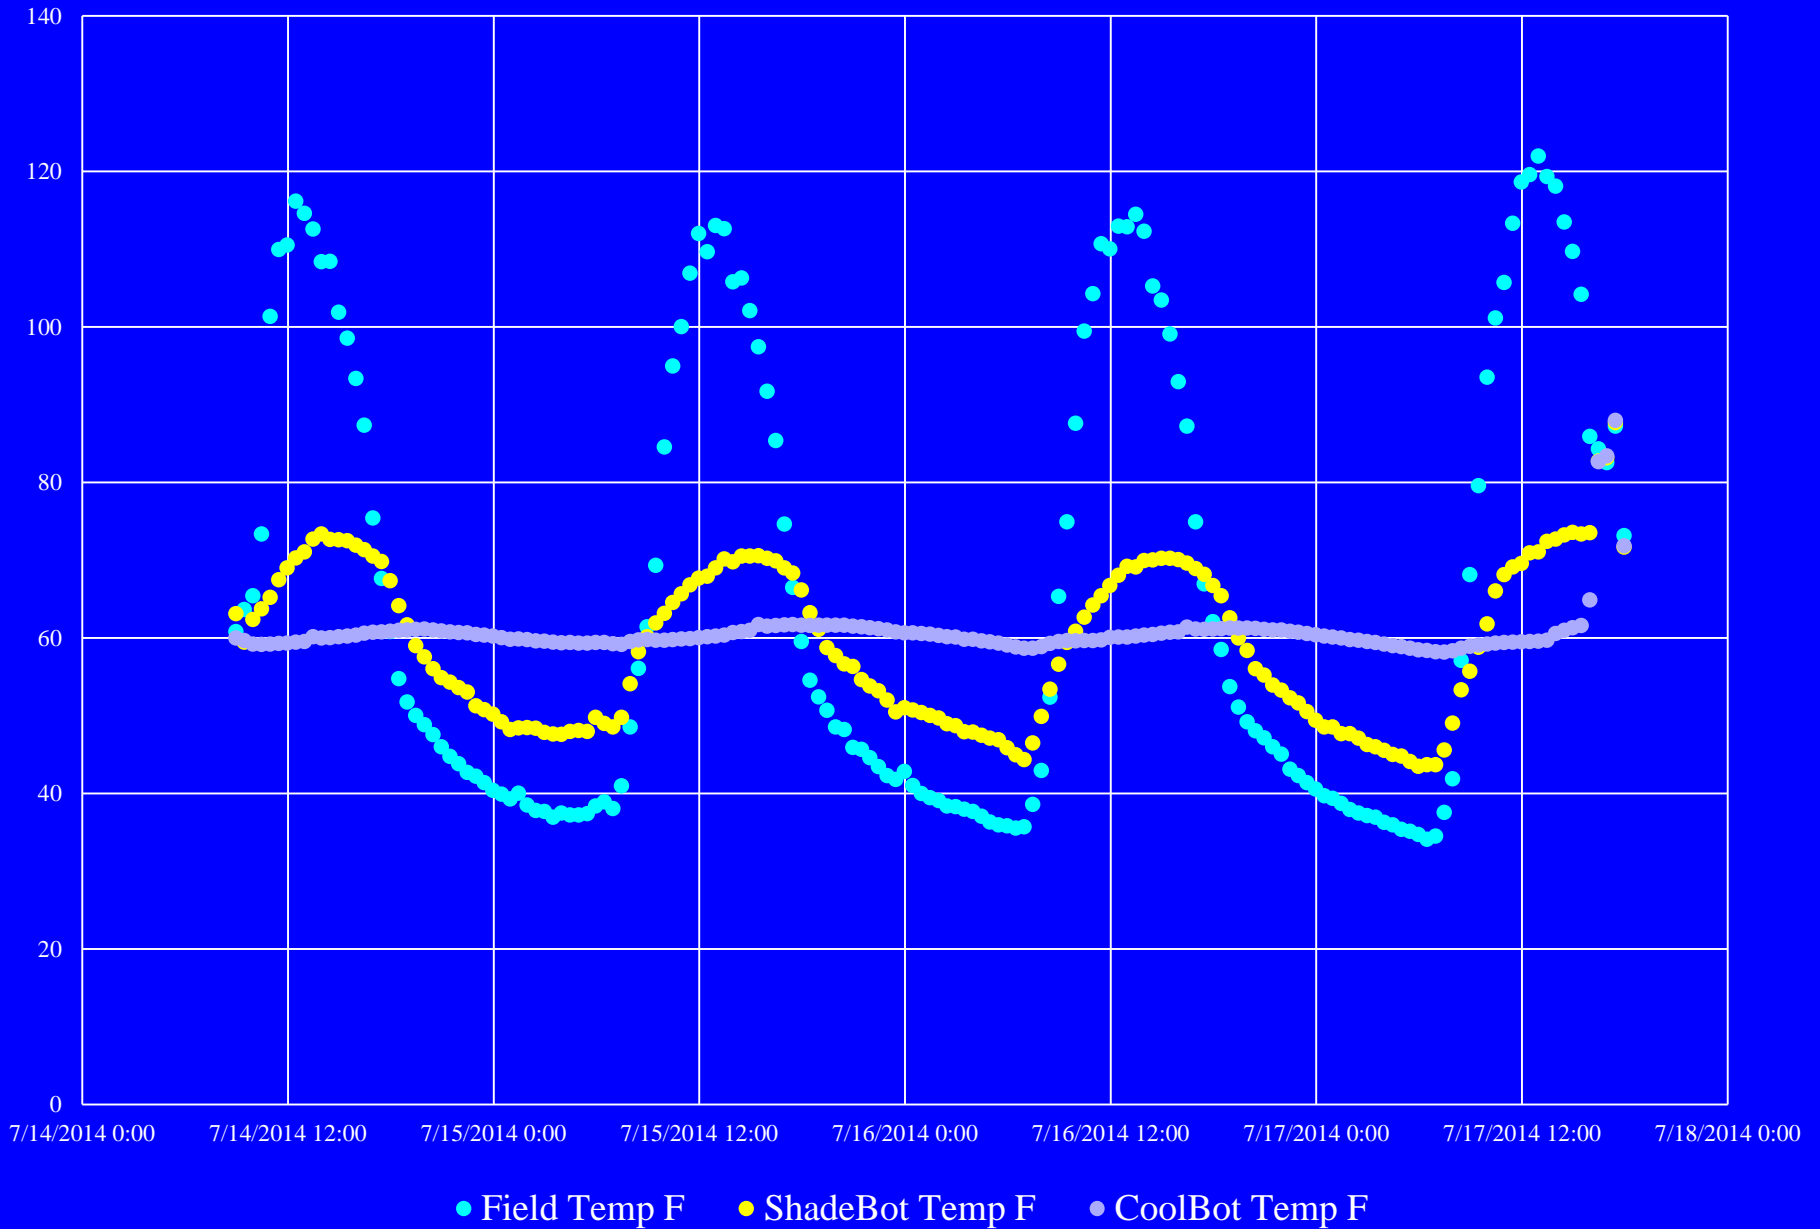

At the hottest points of the day, the CoolBot was more effective than the ShadeBot at reducing the temperatures.

At the hottest point of the day, the ShadeBot reduced the temperature by 35%.

At the hottest point of the day, the CoolBot reduced the temperature by 48%.

# Temperature(F) 7/14/2014 - 7/17/2014

# Quick Glance on Impact of Simply using Shade\*

After this first day all of the vegetables were still able to be sold however, the vegetables left in the field were clearly wilted and marginal when harvested in morning- till early afternoon.

At the end of day 2, the vegetables without PH were unsellable.

Lettuce and Spinach were the only two plants both in the ShadeBot and CoolBot that were still sellable after the second day.

At the end of the third day the lettuce only in the CoolBot (turned off) was still sellable

After the fourth day, no crops were sellable.

*\*Note- this was during the cold season*

# What is Quality?

- Quality is a multiple character of products intended to meet consumer needs
- Quality equals conformance to specifications.
- Good Quality adds value to products
- Increase competitiveness helping to obtain higher prices or facilitate market access
- As other value addition activities there is an associated cost

# Quality characters and quality control procedures

Characters	Hibiscus	Procedure
<b>Color, aroma</b>	Dark red or medium red (pink low quality)	Organoleptic evaluation
<b>Presence of foreign materials</b>	Lower than 1-2%	Visual observation, sieve analysis and ashes
<b>Moisture content</b>	Lower than 12%	Moisture determination by oven method
<b>Active principle content</b>	Amount of anthocyanins (>1%)	Proximate and HPLC analysis

Simple to complex

# Harvesting of hibiscus calyces

# Technologies to obtain clean products

**Hibiscus, Senegal: >35 Grower Groups; >4,000 women;  
Organic certification achieved. FairTrade certification to a few.  
Future challenge: Yields**

**Linking Private Sector Buyers to Communities now organized into grower associations; with improved germplasm and Technology. QC and traceability from field through sales.**

ECOCERT and NOP (USDA) Certifications

# Value addition: quality

- Women producer organizations obtained higher prices for their products
- The production of higher quality hibiscus add value

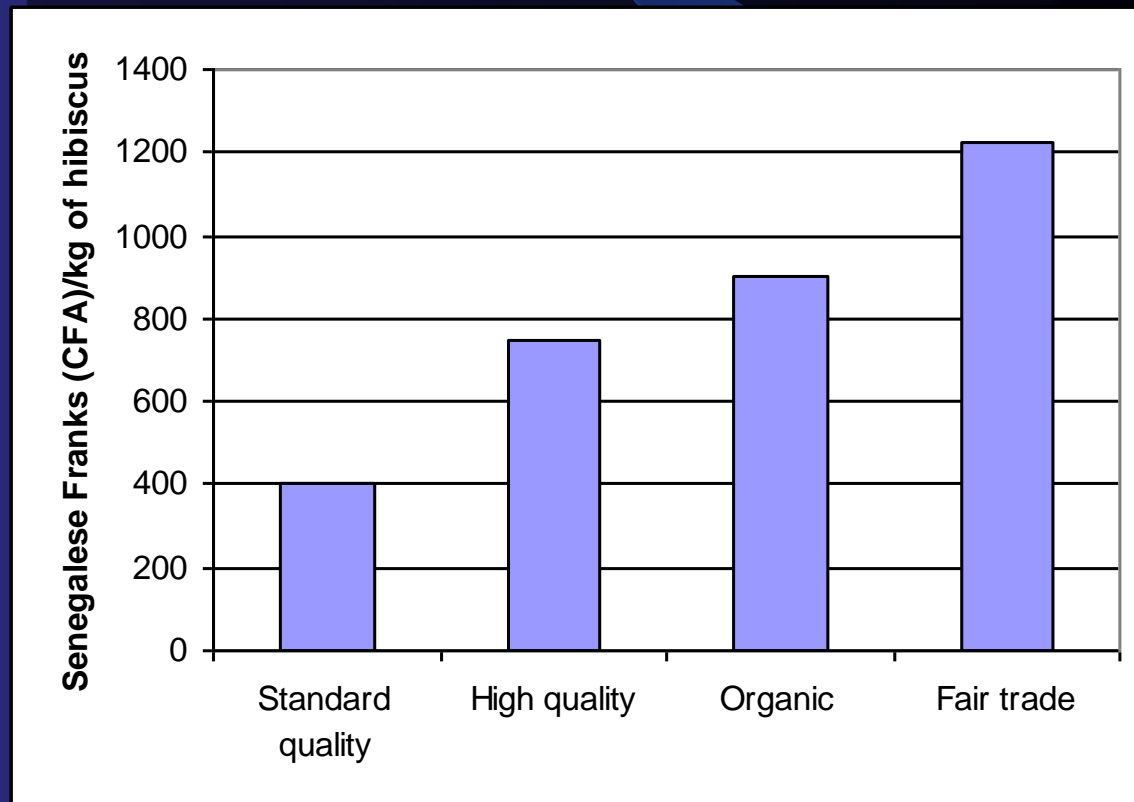

# Value addition: Organic production and certification

- Create new commercial opportunities (organic market is growing faster than the conventional)
- Suitable for Small Scale farmers in Senegal (low input)
- Premium price (CFA150)

# Value addition: Fair Trade certification

- Fair Trade certification bodies guarantee:
  - fair price to producers; hibiscus premium price (CFA320)
- Must invest in social, economic and/or Environmental project.

# PFID/NP Intervention and Results

## Before ASNAPP

- Low yields
- About \$1/kg
- Low production volume
- 
- Neglected crop

## ASNAPP Interventions

- Supplied improved seeds and seeding technology
- Introduced seed pod removal device
- Good agricultural practices
- Instituted vigorous quality systems (Rutgers University)
- Trained 4,000 women annually
- Train 40 Extension Officers annually
- Linkage to buyers
- Products tested locally for Microbial loads

## Results

- 350ha organic certified; 200ha ECOCERT /NOP certified
- Quality of products improved
- Now selling organic hibiscus to ADINA, USA
- Reduced planting time from 14days to 2 days per hectare: Farmer saves \$90/ha
- Price now stands at \$2.2/kg
- ASNAPP assisted farmers receive 30% price premium

# From Gender Divide to Gender Shift: Enterprise Development Success

# Following Best Management Practices

- Great improvements in the quantity and quality
- Senegal was a low quality producer now known for high quality and higher value
- Using a science driven, environmentally and socially sound model created new markets with higher profits and greater demand for use fresh and in processing- powdered
- Few activities support enterprise development more than good business and profits!

# Griffonia (*Griffonia simplicifolia*)

- **Griffonia (*Griffonia simplicifolia*):**
- **A Source of 5-HTP**
- **Seeds are used as an anti-depressant, to treat serotonin deficiency syndrome, and in the treatment of headaches and weight control.**
- **Can be found in the US dietary supplement market for weight loss, an antidepressant, anxiety, in treating fibromyalgia, insomnia**

# GRIFFONIA

## MINIMAL QUALITY REQUIREMENTS

### THE SEED MUST BE:-

- clean, flat, shiny and black/brown in colour;
- dry (max 10% min moisture content) and reasonably uniform in size;
- characteristic taste and odour of variety;
- endosperm shall be yellowish in colour;
- safe and suitable for industrial extracting the oil for medical purpose free from insecticides and pesticides;
- free foreign matter (twigs, leaves, etc.) varied odour and mould;
- free from insect infestation, mites, insect fragments, excrement and rodent contamination;
- free from adulteration (sand, gravel, etc.).

# GRIFFONIA

## ILLUSTRATED QUALITY STANDARDS FOR EXPORT

### MATURITY

#### FULLY MATURED

Matured seeds show cracking along the cleavage line of pod.

#### MATURED

Black spots on the freshly harvested green pod is a sign of maturity.

#### IMMATURED

The harvested pod is all green.

#### SHRIVELLED/HOLLOW SEED

Seed is shrivelled/hollow due to immaturity

### COLOUR

Seed must be brown to black when dried.

#### BROWN/BLACK SEEDS

#### GREEN SEEDS

#### COLOUR UNIFORMITY

Package must show uniformity in colour

### DISEASES

Seeds must be free from decay, insect infestation, excrement and animal contamination.

#### DECAY/MOULD

Seeds show mould and visible signs of rotting

#### INSECT INFESTATION

Insect infestation presence

### POST-HARVEST PROCEDURE

Seeds must be free from extraneous/foreign matter.

#### CLEAN SEEDS

#### FOREIGN MATTER

Seeds with foreign matter

Seeds must be clean, whole and of the same colour.

#### WHOLE SEED

#### SKINNED SEED

#### BROKEN SEED

#### MECHANICALLY DAMAGED SEED

#### MIXTURE OF SEEDS

By working on grades, standards and QC, quality increased, exports have risen, more than tripling

# Griffonia

Griffonia pods and Mature griffonia seeds after drying

Griffonia collectors from one of the cooperatives and groups organized in Ghana.

The bag contains dried griffonia seeds (see rack) paid to a collector that will provide enough income to pay for one month of rice for his family (in Liberia, 2/ 2010).

# Plants as a Delivery System to Improve Human Nutrition, Health & Reduce Disease: Moringa

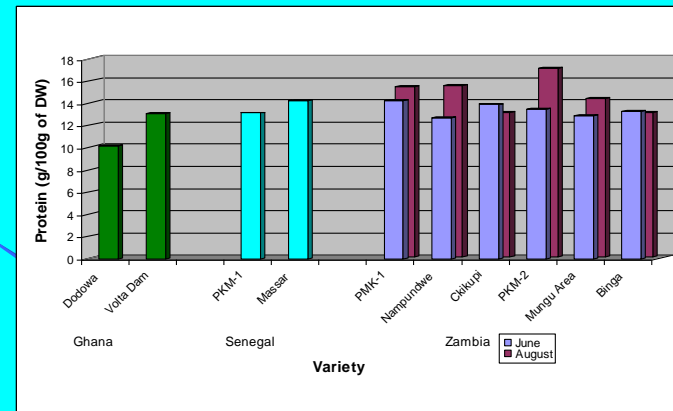

- Moringa, an endemic tree found across sub-Saharan Africa with 13 species, *M. oleifera*, the main spp. of interest.
- Very rich in vitamins A and E, iron, zinc, selenium (same vitamins and minerals that have been identified as the major limiting nutritional factors in the same region particularly for vulnerable populations)
- Leaves, pods and seeds rich in glucosinolates and flavonoids

# Total Protein

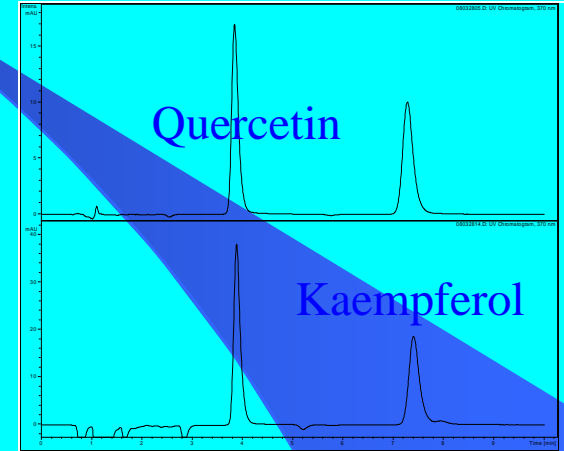

**Child between 1 to 3 years old is 13 grams/day**  
**Child between 4 to 8 years old is 19 grams/day**

Location	Ascorbic Acid mg/100g	Total tocopherols (mg)	Total Carotenoids (mg/100g)

# 2014: Chilli's and PH Zambia

**Quality and Chemistry of African Birds Eye Chili (*Capsicum frutescens*) from Zambia**

Kudus Zulu, Zulu Cupps, Vadi Frossard, Helina Ndlovu, Shamsi Bhebe, and Joe Mwa'.

**1. INTRODUCTION**

Chilli is a widely cultivated vegetable crop in Zambia. It is a member of the Solanaceae family and is known for its pungent taste and medicinal properties. The quality and chemistry of chilli are influenced by various factors, including soil type, climate, and cultivation practices. This study aims to evaluate the quality and chemistry of African Birds Eye Chilli from Zambia.

**2. MATERIALS AND METHODS**

The study was conducted in a field setting in Zambia. The chilli plants were grown under different soil conditions and irrigation treatments. The fruits were harvested at maturity and analyzed for various quality parameters, including moisture content, total solids, and pungency.

**3. RESULTS AND DISCUSSION**

The results of the study show that the quality and chemistry of African Birds Eye Chilli from Zambia are significantly affected by soil type and irrigation. The plants grown in fertile soil and with adequate irrigation produced higher yields and fruits with higher moisture content and total solids. The pungency of the fruits was also higher in these plants. The results suggest that farmers should use good agricultural practices to improve the quality and chemistry of their chilli crops.

**4. CONCLUSION**

The study concludes that the quality and chemistry of African Birds Eye Chilli from Zambia are significantly affected by soil type and irrigation. Farmers should use good agricultural practices to improve the quality and chemistry of their chilli crops.

**Chemical diversity of capsaicinoids and polyphenols in *Capsicum* spp.**

Daniel Chikwe, Kaitany Chikwe, Albert Kanyo, Tere Chikwe, Ed Dingo, Nelson Pinyo, Chung Park, Qing Wu, James Shroyer

**1. Introduction of capsaicinoid content**

Capsaicinoid content is a key quality attribute of chilli. It is determined by the concentration of capsaicin and dihydrocapsaicin in the fruit. The capsaicinoid content of chilli is influenced by various factors, including soil type, climate, and cultivation practices. This study aims to evaluate the chemical diversity of capsaicinoids and polyphenols in *Capsicum* spp.

**2. Materials and Methods**

The study was conducted in a field setting in Zambia. The chilli plants were grown under different soil conditions and irrigation treatments. The fruits were harvested at maturity and analyzed for various quality parameters, including capsaicinoid content and polyphenol content.

**3. Results and Discussion**

The results of the study show that the chemical diversity of capsaicinoids and polyphenols in *Capsicum* spp. is significantly affected by soil type and irrigation. The plants grown in fertile soil and with adequate irrigation produced higher yields and fruits with higher capsaicinoid content and polyphenol content. The results suggest that farmers should use good agricultural practices to improve the chemical diversity of their chilli crops.

**4. Conclusion**

The study concludes that the chemical diversity of capsaicinoids and polyphenols in *Capsicum* spp. is significantly affected by soil type and irrigation. Farmers should use good agricultural practices to improve the chemical diversity of their chilli crops.

Proper PH with chillis for the fresh market led to a 40% increase over 'street price'.

Using GAP/BP and good PH led to buyer acceptance of dried chillis.

**Opening Up New Markets with Nutritious Labeling on Value Added Products: Using Dried African Indigenous Vegetables**

Shamsi Bhebe, Daniel Chikwe, Kaitany Chikwe, Qing Wu, Ed Dingo, Nelson Pinyo, Chung Park, Qing Wu, James Shroyer

**1. Introduction**

The study aims to evaluate the nutritional value and market potential of dried African indigenous vegetables. These vegetables are rich in nutrients and have a long shelf life, making them a valuable addition to the diet. The study will focus on the nutritional composition and market acceptance of these products.

**2. Materials and Methods**

The study was conducted in a field setting in Zambia. The vegetables were grown under different soil conditions and irrigation treatments. The products were then analyzed for various nutritional parameters, including protein, fiber, and vitamins.

**3. Results and Discussion**

The results of the study show that the dried African indigenous vegetables have a high nutritional value and are well-accepted by the market. The products are rich in protein, fiber, and vitamins, and are easy to digest. The results suggest that farmers should use good agricultural practices to improve the nutritional value of their products.

**4. Conclusion**

The study concludes that the dried African indigenous vegetables have a high nutritional value and are well-accepted by the market. Farmers should use good agricultural practices to improve the nutritional value of their products.

# Horticulture Innovation Lab

# African Birds Eye Chili

Commercial name	Birds eye chili
Botanical name	<i>Capsicum frutescens</i>
Origin	Zambia (Production 2009)
Additives	None
Sensory/macroscopic evaluation <sup>1</sup>	09-BE-FA
Color	Dark Red
Aroma	Spicy, free of foreign odors
Taste	Highly pungent
Length of pods (cm)	2.4
Scoville Heat Units (SHU) <sup>2</sup>	52,000 <sup>2</sup>
Physical/Chemical properties <sup>1</sup>	
Moisture content % (m/m)	12
Total ashes % (m/m)	12
Total insoluble ashes % (m/m)	0.8
Active principle <sup>1</sup>	
Total capsaicinoids <sup>3</sup> content % (m/m) (by HPLC)	0.35

# Drying Facility- Home Built

- Cold chain involves all steps from farm gate to market
- Includes: Transportation
- Retrofit trucks, pick-up's to have cold insulated chambers
- Keep produce in shade
- Protect produce

How many crates can  
you stack?

# Appropriate Technologies for Post-Harvest

- Shade- umbrellas to netting used in fields and after;
- Low-cost affordable coolers- different types, styles for local conditions and needs
- Buying and rebuilding used larger ones from refrigerated trucks as your stationary coolers
- Maintain quality, be creative

**Bringing it together: Farmers selling their fresh produce to Livingstone hotels, and learning entrepreneur skills are leading to significant economics benefits to his family and the community producers.**

# Comments on the Value of Improving PH:

- Horticulture can provide for increased food security by income generation, community development, empowerment of individuals and communities and providing the means to purchase foods and supplies and improve one's own health and nutrition.
- Horticulture teaches and provides a myriad of skills and expertise that can be later used for other many other enterprises. Thus, can be seen in part as a vehicle to educate, teach and ultimately provide others with hope, confidence and strategies to their livelihoods
- Many models are dynamic, and lend themselves to scale-up
- Horticulture is knowledge intensive. Yields and quality directly related to inputs, management and the profitability of such investment can be lost without proper PH practices.
- **As volumes and # of grower increase, distance to market increases, the need to hold produce under proper conditions becomes a priority.**
- Different approaches and technologies in PH can be applied.
- Success is enhanced by ensuring a market-first, not the traditional production-first approach coupled with appropriate PH systems.
